

Multitasking across the critical material supply chain, Auxico Resources is focused on rare earths in Colombia

written by InvestorNews | December 21, 2021

Every once in a while, I get to discuss a company of which it is hard to capture the true essence. For the most part, when we look at junior mining (exploration and early development) companies, they are focused either geographically or by resource, but one way or the other, they are a junior mining, basically exploration, company. Occasionally, they are also dabbling in special or creative ways to process the particular ore at the heart of their operations. But today we are going to dig into a company that does all of the above, as well as getting into the marketing and sales of the finished products, whether it be theirs or not. And at first glance, it's almost hard to tell which opportunity has the most upside. Given my background, my bias is the marketing side of things, but I will try and keep an open mind as we dig into this interesting and somewhat unique company.

Without further ado, let's have a look at [Auxico Resources Canada Inc.](#) (CSE: AUAG), which is a combination project generator, miner, processor and marketer all rolled up into one. Auxico is a Canadian company, founded in 2014 and based in Montreal, engaged in the acquisition, exploration and development of mineral properties in Colombia, Brazil, Bolivia, Mexico, the Democratic Republic of the Congo and the Ivory Coast

(so far). Across these countries, Auxico is involved in gold, silver, coltan (which I had never even heard of before but is a dull black metallic ore from which the elements niobium (aka, columbium) and tantalum are extracted), iridium, tin, manganese and last but certainly not least a full basket of Rare Earths.

Perhaps you might be starting to get a feel for why this is a tough Company to talk about but wait there's more...a lot more. The Company has numerous agreements in place to market various products to generate cash flow today, which is not typical for a junior mining company. A great example is [manganese ore sales from Brazil](#) to India, China and the UAE. Auxico has purchased and sold a total of 15,000 metric tons of manganese ore, with a minimum grade of 46% Mn (~15% net profit margin), as part of two contracts with customers to provide for shipments of up to 120,000 MT per month cumulative of manganese ore. Additional marketing agreements include an [MOU for exploitation and commercialization](#) of tantalum, niobium, iridium and tin from industrial sands located in Bolivia, and an [LOI for the exploitation and trading](#) of tantalum and iridium in Ivory Coast. These and other similar arrangements serve the company in two ways. As noted, it provides a source of revenue to the Company, so they don't always have to go to the market and raise cash to drill more on their exploration properties and it gets them into the deal flow to potentially acquire interests in some of these mining plays if they so desire.

I also made mention early about being an innovator on the processing side of the equation. On July 30th Auxico [signed a technology license agreement](#) with Central America Nickel for the use of a patent-pending ultrasound assisted extraction process ("UAEx") for mineral extraction. The UAEx process is a sustainable metallurgical process for the refining of critical minerals using ultrasound technology. In particular, artisanal

gold miners, who produce an estimated 15 million ounces of gold yearly, use mercury in their process plants. The UAEx process is able to extract gold and silver in less than one hour in a closed-loop system and does not use cyanide or mercury, which can solve the environmental issues created by artisanal mining. Additionally, this process will dramatically reduce capital and operating costs as most known metallurgical processes that use sulfuric acid, cyanide or hydrochloric acid do so in a 24-hour cycle. As you could well imagine, this could be Auxico's diamond in the rough, but it might not even be the most exciting aspect of the Company.

I think I've saved the best for last, at least as things currently stand for Auxico, and that's the rare earths project in Columbia. Auxico has [discovered high-value rare earths](#) with total rare earth oxide content over 56% at the Company controlled Vichada property. And if that's not good enough, they've also [discovered platinum group metals](#) on the property along with tantalum, niobium and tin. The Company has an MOU agreement with the Colombian company Minampro Asociados S.A.S., to earn a 70 % interest. Auxico's partner has an exclusive purchase agreement for industrial sands within 20,000 hectares of land owned by the indigenous community Guacamayas-Maipore.

The graph below is an eye opener:

My head is starting to spin thinking about all the things on the go at Auxico so I will leave it here for now. To summarize they have impressive exploration prospects, a sustainable, environmentally friendly mineral extraction process, and marketing agreements that are already generating revenue. That's quite a bit going on for a company that currently has a market

cap of roughly \$84 million. I don't think I'd even know where to start to try and value all the various parts, but the Colombian assets have definitely caught my eye.
