

InvestorTalk Alert: Kevin Keough from Romios Gold Resources Inc. to host on Tuesday, August 12, 2025

written by InvestorNews | August 11, 2025

InvestorNews.com is pleased to announce an upcoming InvestorTalk scheduled for tomorrow, Tuesday, August 12th, at 9:00 AM EST, featuring Kevin Keough, CEO, from [Romios Gold Resources Inc.](#) (TSXV: RG). To participate in this engaging discussion, please [click here](#)

Romios Gold Resources Inc. is a Canadian mineral exploration company focused on gold, copper, and silver. In 2025, it shifted to drilling on key properties in highly prospective North American regions. Assets include porphyry copper-gold prospects in BC's Golden Triangle, led by the drill-ready Trek South, plus the JW and Red Line projects near Galore Creek. In Nevada, it holds the Kinkaid claims in the Walker Lane Trend and the Scossa mine in the Sleeper Trend. Other holdings include the Lundmark-Akow Lake Au-Cu property near the Musselwhite Mine and 2% NSR royalties on properties in Ontario and British Columbia.

In preparation for tomorrow's InvestorTalk, here are some recent news releases from Romios Gold for your review, which are listed below:

- August 7, 2025 – Romios Gold Samples Epithermal Style Gold at the Kinkaid Cu-Au-Ag Project, Nevada – [click here](#)
- July 30, 2025 – Romios Announces Over-Subscription and Increase of Non-Brokered Offering to \$750,000 – [click here](#)

- July 23, 2025 – Romios Announces \$500,000 Non-Brokered Offering – [click here](#)

Here are 5 key data points from their August 7th news release titled, *“Romios Gold Samples Epithermal Style Gold at the Kinkaid Cu-Au-Ag Project, Nevada”*:

- **High-Grade Assay Result** – A chip sample from a hematitic quartz pod/vein in the southern Kinkaid claims returned 13.95 g/t Au within a >20 m wide sericitic alteration zone.
- **Additional Gold & Copper Values** – Nearby mineralized structures assayed 6.09 g/t Au, 3.04 g/t Au, and 0.62 g/t Au with associated copper grades ranging from 0.71% to 1.7% Cu across a 75 m wide mineralized area.
- **New Gold Zone in Northern Claims** – On the northern Kinkaid claims, a 30 m wide zone of silica flooding, veining, and brecciation adjacent to the PM Skarn yielded 3.2 g/t Au from brecciated quartzite and 0.28 g/t Au with 617 ppb Hg from a chalcedony vein. The brecciated quartzite is considered a new and potentially extensive host rock for gold mineralization, expanding the exploration potential beyond known skarn-hosted zones.
- **Potential Porphyry Centres** – Geological mapping suggests five 1 km-wide clusters of vein workings, alteration zones, and garnet skarns likely represent the tops of multiple porphyry Cu-Au-Ag systems.
- **Exploration Plans** – Romios Gold aims to advance Kinkaid to drill-ready status through additional sampling, mapping, and induced polarization (IP) surveys over identified intrusive targets.
