

Murchison Minerals Ltd. Announces Start of Geotech VTEM Survey Across HPM Nickel- Copper-Cobalt Project in Quebec

written by Raj Shah | April 15, 2021

April 14, 2021 ([Source](#)) – Murchison Minerals Ltd. (“**Murchison**” or the “**Company**”) (TSXV:MUR) today announces that the VTEM airborne geophysical survey has commenced following promising recent prospecting results ([see November 19, 2020 release](#)) on its 100% owned HPM Ni-Cu-Co (“HPM”) project in Quebec.

The Geotech VTEM 655-line kilometre survey over the HPM property will be flown with a 100-line spacing.

Murchison has also commissioned a satellite remote sensing study to detect alteration signatures on the property which, when completed, will integrate all pertinent data including the airborne survey to identify the most prospective drill targets in this coming field season.

JC Potvin, Murchison’s President and CEO, comments: “The HPM project continues to show tremendous promise with its numerous gossanous nickel-copper-cobalt-bearing outcrops spatially linked to historical airborne EM anomalies. It is well-known that the prolific Voisey’s Bay Mine, some 620 km from our HPM project, was originally prospected and mapped as a pyritic gossan. There, leaching of metals from the deeply-weathered surficial cap yielded little or no anomalous metal concentrations in the first sampling yet Voisey’s Bay is one of world’s most spectacular

nickel-copper-cobalt mines.”

Historically, exploration and drilling on the HPM property focused on the immediate area around the Barre de Fer showing. The anomalous Ni-Cu-Co results from mafic intrusions 0.5-2.5 km outside of that area, obtained from the recent reconnaissance prospecting program, demonstrate the potential for a mineralization system that is larger than previously thought.

The 58 km² HPM property lies within the Grenville Province’s Allochthonous Belt and is host to numerous Ni-Cu-Co showings associated with mafic to ultramafic intrusions, including the high-grade Barre de Fer magmatic nickel sulphide occurrence. The Barre de Fer occurrence returned up to 1.74% Ni, 0.90% Cu, and 0.09% Co over 43.18 m in historic diamond drilling. Results from this short reconnaissance-prospecting program in conjunction with other historic results provide additional encouragement for a follow-up program at HPM.

Murchison also announces that it has granted 200,000 stock options to a consultant of the Company. The stock options are exercisable for a period of 5 years at a price of \$0.095 and vest immediately.

About Murchison Minerals Ltd. (TSXV: MUR)

Murchison is a Canadian-based exploration company focused on the exploration and development of the 100% owned Brabant-McKenzie zinc-copper-silver project in north-central Saskatchewan. The Company also has a 100% interest in the HPM nickel-copper-cobalt project in Quebec. Murchison has 108.9 million shares issued and outstanding.
